AUTHOR: Yudin, V.M.

TITLE: Weak ferromagnetism of BiFeO_3 /Report, Symposium on Ferromagnetism and Ferroelectricity held in Leningrad 30 May to 5 June 1983/

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v.28, no.3, 1984, 451-453

TOPIC TAGS: complex ferrite, bismuth ferrite ferromagnetism, weakly ferromagnetic antiferromagnetic material, BiFeO_3

ABSTRACT: The magnetic properties of the solid solution $0.9\text{BiFeO}_3-0.1\text{Pb}(\text{Fe}_{1/2}\text{Nb}_{1/2})\text{O}_3$ were investigated with a magnetic balance, employing the Faraday method. The investigation was undertaken because BiFeO_3 is known to have the perovskite structure with one ferric ion in the unit cell and shows the sharp maximum in the magnetic susceptibility at the Neel point characteristic of antiferromagnetic materials having weak ferromagnetic properties, and yet it has not been possible to observe spontaneous magnetization. Neutron scattering investigations have shown that BiFeO_3 has the type G magnetic structure and has a superstructure due to displaced oxygen. $\text{Pb}(\text{Fe}_{1/2}\text{Nb}_{1/2})\text{O}_3$ is antiferromagnetic and has a single perovskite type unit cell,

Card 1/3

ACCESSION NR: AP4023390

rhombohedral below the ferroelectric Curie point (120°C) and cubic above it. The material was produced by solid state reaction of chemically pure Nb_2O_5 and reagent grade pure Bi_2O_3 , Fe_2O_3 and PbO . The polycrystalline samples were annealed at 850°C for three hours, and an x-ray study showed them to be true solid solutions. Magnetic susceptibility measurements showed antiferromagnetic ordering to occur at 610°K . Near this temperature, spontaneous magnetization occurred, but none could be observed at significantly lower temperatures. After the samples had been cooled from above the Neel point to liquid nitrogen temperatures in an 8 kOe magnetic field, however, a spontaneous magnetization of about $0.03 \text{ gauss cm}^3/\text{g}$ was observable at low temperatures. The magnetic orientation produced by this treatment was stable in time and could be destroyed by heating above the Neel temperature and cooling in the absence of a field. The spontaneous magnetization observed cannot be ascribed to ferrimagnetism due to the Fe and Nb ion, for the Nb concentration is too small and there is no Fe-Nb ordering in pure $\text{Pb}(\text{Fe}_{1/2}\text{Nb}_{1/2})\text{O}_3$. It is concluded, therefore, that BiFeO_3 is weakly ferromagnetic. It is suggested that the effect of the addition of a small quantity of $\text{Pb}(\text{Fe}_{1/2}\text{Nb}_{1/2})\text{O}_3$ is to reduce the magnetic rigidity of the BiFeO_3 and thus make it possible to observe the spontaneous magnetization.

"The author expresses his gratitude to Professor G.A.Smolenskiy for his interest in the work and discussion of the results, to Ye.S.Sher for preparing the samples, and

TITLE: New guns for manual argon shielded arc welding of titanium articles

SOURCE: Avtomaticheskaya svarka, no. 9, 1966, 54-56

TOPIC TAGS: titanium, ~~welding~~, welding technology, welding equipment, welding gun, ~~argon shielded arc welding~~

ABSTRACT: Two guns for manual argon shielded arc welding of titanium have been developed. The salient feature of both guns is the gas-nozzle diameter (30—50 mm) which produces a wide laminar low-velocity gas stream extending up to 120 mm from the tip of the nozzle. Welding is performed with the argon flow directed against the direction of welding. The stream of argon spreads over the welded joint and adjacent hot zone, protecting them from oxidation. One gun (see Fig. 1) is equipped with automatic feed of the filler wire. It differs from standard guns in that the electrode (16) and gas nozzle (15) are separated: with the electrode in the vertical position, the gas enters the welding zone at an angle of 25—30°. Filler wire is fed automatically through the nozzle (14). The new welding guns simplify the process of welding titanium alloys and give adequate protection against

TITLE: The transparent hexagonal ferrimagnet Mn_2SiO_4 .

ABSTRACT: The compound Mn_2SiO_4 is a transparent ferrimagnet with a Curie temperature $T_C = 14^\circ\text{C}$.

It is characterized by a large magnetic moment, a high anisotropy, and a low temperature coefficient of resistance.

As the temperature increases, the compound has been confirmed to be paramagnetic. The authors have investigated the magnetic properties of single-crystal samples and the Faraday method, at $T_C = 14^\circ\text{C}$ and 14°C above the transition temperature. The Mn_2SiO_4 samples have positive reaction at 14°C . They are transparent. An interesting feature is that in the temperature interval 14°C the color continuously from bright green to pink. The Mn_2SiO_4 exceeds 10^{11} ohm-cm , and the dielectric constant is 10^4 . Perfect crystals $1 \times 5 \times 5 \text{ mm}$ without cleavage faces. TITLE: The transparent hexagonal ferrimagnet RbNiF_3

SOURCE: Fizika tverdogo tela, v. 8, no. 10, 1966, 2965-2969

TOPIC TAGS: rubidium compound, magnetic property, magnetic susceptibility, magnetic anisotropy, Curie point, magnetic structure

ABSTRACT: The purpose of the investigation was to study the magnetic properties of single-crystal RbNiF_3 , both above and below the magnetic-transition temperature. In view of the fact that they were hitherto investigated only in the polycrystalline form in single-crystal form. Transparent RbNiF_3 crystals with low dielectric losses can be of interest for modulation of light beams in microwave devices. The single crystals were obtained by exchange decomposition of Rb_2NiF_6 and RbF . The magnetic properties were investigated with a magnetic balance in fields from 2 - 14 kOe. The apparatus was described earlier and was modified to accommodate anisotropic crystals. The reciprocal magnetic susceptibility was measured as a function of the temperature and the magnetic-transition temperature was determined as functions of the field intensity at different temperatures. The results confirm that RbNiF_3 is a ferrimagnet of the ferroplan type with a Curie point at 10 K.

TITLE: A New Method for Speedy Analysis of Slag for Phosphorus by Means of Radioactive Tracers (Novyy metod ekspress-analiza shlaka na fosfor s primeneniym radioaktivnykh indikatorov)

PERIODICAL: V sb.: Fiz. -khim. osnovy proiz-va stali. Moscow, AN SSSR, 1957, pp 82-93. Diskus. pp 160-187

ABSTRACT: A method has been developed for speedy analysis of slag for P_2O_5 by means of radioactive P (I). The analysis requires 5-7 min. The method is accurate to within 5-6 percent (rel.). The consumption of material is 0.04-0.05 millicurie per t of metal. To determine P_2O_5 , I is introduced into the heat in a mixture with powdered Fe. The mixture is placed in a Cu ampoule and the I with the Fe form ferrophosphorus during the period of heating and fusion. This then undergoes uniform dissemination throughout the volume of the heat. Determination of P_2O_5 by radiometry requires one tagged sample in which the P_2O_5 is

Card 1/2

A New Method for Speedy Analysis of Slag for Phosphorus (cont.)

determined chemically. A graph showing determination of P_2O_5 by radiometry as compared with the data of chemical analysis is presented. The employment of radiometric analysis of slag for P_2O_5 makes it possible to take and analyze a large number of samples of slag in the course of a heat.

TOPIC TAGS: marine engineering, ship component, ~~ship navigation, navigation equipment~~, ~~gyroscope, electronic circuit, pressure transducer~~

ABSTRACT: An Author Certificate has been issued for a device for compensating a vessel's heel against a gust of wind, consisting of an automatic rudder with control devices and electric power supplies. To achieve partial compensation of heeling moments, decrease the dynamic heeling angles during wind gusts, and assure the automatic return of the ship to its course after the gust has passed, it is equipped with a correcting device made in a form of a chamber with air vents leading in and out and containing electrical contacts and vertically movable disks. These close the appropriate contacts, depending on the wind direction, and a rotating transformer with a stator is connected to the contacts, which change current-supply polarity in relation to the position of the movable disks. A rotor is connected to the automatic rudder's electrical circuit. Also, to calculate the vessel's roll-angle speed, it is equipped with a gyroscopic device, the precession axis of which is located in the vessel's frame, with an electric transducer which feeds signals proportional to

TITLE: New Technical Processes in the Metallurgical Industry (Novyye tekhnologicheskkiye protsessy v metallurgicheskom proizvodstve)

PERIODICAL: V sb.: Novyye tekhnol. protsessy. Khar'kov, Oblizdat, 1957, pp 5-27

ABSTRACT: Certain advances in the technical processes of "small-scale metallurgy" at the Khar'kov Transportation Equipment Plant are set forth. O₂ is used at this plant to speed the smelting of steel in electric furnaces and to heat liquid iron in cupola receivers and crucibles. The process of developing techniques for the manufacture of cast-iron crankshafts for the TE-3 Diesel locomotive, and the techniques used in casting steel ingots 13.5 t in weight, which are large for this plant, are described. A special section of the article is devoted to precision casting: investment casting, skin dry sand mold casting, chill casting of non-ferrous metals, and also the manufacture of forgings by drop-forging instead of open-die forg-

TITLE: Experiences in the Making of Cast-iron Crankshafts for Main-line Diesel Locomotives (Opyt izgotovleniya litykh chugunnykh kolenchatykh valov dlya magistral'nykh teplovozov)

PERIODICAL: Tekhnologich. transp. mashinostroyeniya, 1957, Nr 2, pp 12-18

ABSTRACT: The casting of crankshafts for the 2000-hp D-100 Diesel has been perfected at the Khar'kov Transportation Equipment Plant. Shafts weighing 1740 and 1490 kg are cast from pig iron of the following % contents: C 2.2-2.4 and alloyed Mo 1, Cr 0.6 and Ni 1. On rupture, $\sigma_b(\text{tension}) > 35 \text{ kg/mm}^2$ and $\sigma_b(\text{bending}) > 70 \text{ kg/mm}^2$. Utilization of metal when the blank is cast is close to 47%, while only 14% of the metal can be used in forging. Horizontal pouring is recommended in single-unit production, as inclined and vertical pouring require the construction of pouring fixtures, although they do increase the yield by 50% relative to horizontal and reduce machining to a minimum. The optimum pouring temperature is 1360-1370°C. A thermit

167

Yudin, Yefrem Markovich

Shesterennyye nasosy; osnovnyye parametry i ikh raschet (Gear-wheel Pumps; Basic Parameters and Their Design) Moscow, Gosud. izd-vo oboronnoy promyshlennosti, 1957. 139 p. Number of copies not given.

Ed.: Rosenblit, S. Ya., Engr.; Ed. of Publishing House:
Sokolov, A. I., Engr.; Tech. Ed.: Lebedeva, L. A.;
Reviewer: Yasinskiy, S. Ya., Engr.

PURPOSE: This book is for design engineers, engineers of scientific research institutes of machine building, and engineering and technical personnel working in the field of design, manufacture and operation of gear-wheel pumps.

COVERAGE: The author states that in preparing this book he has utilized service experience with pumps in aircraft industry where they are used in fuel supply and lubrication systems and for controlling retractable landing gears and variable-pitch propellers. The following subjects are discussed: design of aircraft fuel supply pumps for high-altitude performance; design and correction of gear tooth profiles with the use of a method developed by the author and

Card 1/6

Gear-wheel Pumps; Basic Parameters and Their Design (Cont.) 167

accepted by the Ministry of the Aircraft Industry; derivation of equations for determining pump theoretical capacity; design of pressure relieving grooves; analytical method for determining gear bearing loads and support reactions; methods and examples of pump design; and the design of special type spring-loaded floating sealing rings. The author claims that the use of such seals cuts down the leakage and increases the volumetric efficiency of a gear-wheel pump up to 95%, which approaches the efficiency of a piston pump. The book includes tables of experimental data on pumps, nomograms for selecting pumps, and charts showing viscosities of domestic oils and petroleum products. No bibliography is listed.
